

World Password Day

7th May 2026

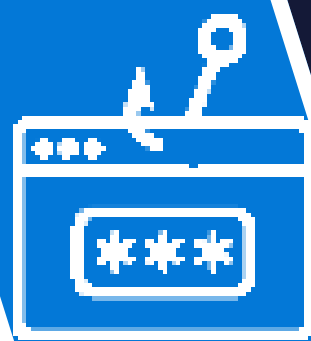

1 Multi-factor Authentication

Requires two forms of authentication, providing an extra layer of protection for accounts

2 Phishing-Resistant Authentication

The most secure type of MFA. Designed to prevent password phishing attempts by using methods that verify a users identity

3 Passkeys

A phishing-resistant sign-in method that lets users log in using the same fingerprint, face scan, or PIN they already use to unlock their device

4 Ensure Recovery

Users should have a backup plan so that accounts can be accessed/recovered even if a device is lost
